CONTENTS

Pythagoras' Theorem in 3D.....	2
Trigonometry in 3D.....	8

OVERVIEW

SYLLABUS CONTENT

MA5-TRG-P-01 applies Pythagoras' theorem and trigonometry to solve 3-dimensional problems and applies the sine, cosine and area rules to solve 2-dimensional problems, including bearings

Solve 3-dimensional problems involving right-angled triangles

- Apply Pythagoras' theorem to solve problems involving the lengths of the edges and diagonals of rectangular prisms and other 3-dimensional objects
- Apply trigonometry to solve problems involving right-angled triangles in 3 dimensions, including using bearings and angles of elevation and depression

PYTHAGORAS' THEOREM IN 3D

- When working in 3D, simplify the question to 2D.
 - Break down 3D diagram into 2D triangles.
 - Use Pythagoras' Theorem to find unknown sides.
 Do not round until your final answer.

Pythagoras in 3D: <https://www.geogebra.org/m/mpnd5fck>

Example Solve problems involving Pythagoras' Theorem in 3D.

Calculate the length of diagonal BH.

Round your answer to 2 decimal places.

Step 1: Consider relevant triangles.

Step 2: Use triangles to find unknown sides

Calculate EB

$$EB^2 = 4^2 + 7^2$$

$$EB = \sqrt{4^2 + 7^2}$$

$$= \sqrt{65}$$

Calculate BH

$$BH^2 = 2^2 + (\sqrt{65})^2$$

$$= 69$$

$$BH = \sqrt{69} \approx 8.31 \text{ cm}$$

Why did we leave EB in exact form, rather than as a rounded decimal?

Leaving in exact form gives a more answer compared to using the rounded decimal.

a

Calculate the length EB .

$$\sqrt{89} \text{ cm}$$

b

Calculate the length AF .

$$\sqrt{129} \text{ cm}$$

- 1 In these questions you will only need to consider a single triangle. Find the value of d .
Answer to 2 decimal places.

a

11.18 mm

b

0.34 m

c

19.75 cm

- 2 Calculate the slant height of these cones. Answer rounded to 1 d.p.

a

3.6 cm

b

2.5 cm

- 3 Calculate the length of the longest rod that can fit inside this cylinder with a diameter of 10 cm and a height of 15 cm. Round to 1 d.p.

18.0 cm

- 4 For each of these rectangular prisms, first find BE, leaving your answer in exact form, then find BH, rounded to 2 decimal places. Draw and label the right-angled triangles you are using.

a

$$BE = \sqrt{34}, BH = 6.16$$

b

$$BE = \sqrt{80}, BH = 16.61$$

c

$$BE = \sqrt{10}, BH = 7.68$$

d

$$BE = \sqrt{68}, BH = 12.21$$

5 Calculate the length of the diagonal AD, correct to 1 d.p.

15.0 cm

6 Calculate the value of x in each of these diagrams, to 2 decimal places.

a

13.62 m

b

4.53 m

c

2.61 m

d

5.23 cm

7 Here is a square pyramid.

a Work out the length of BD in exact form.

b M is the midpoint of BC

i Write the length of BM.

ii Work out the length of EM, in exact form.

$$\sqrt{10^2 - 3^2} = \sqrt{91} \text{ cm}$$

iii Work out the perpendicular height of the pyramid, to 1 decimal place.

9.1 cm

- 8 Here is a triangular prism.
Calculate these lengths, give your answers to 1 decimal place, where appropriate.

a BC

5 m

b AE

16.5 m

c AF

16.3 m

- 9 The diagonal of a cube measures 20 m. Calculate the following, rounding your answers to 1 d.p.
- the volume of the cube
 - the surface area of the cube.

1539.6 m³, 800 m²

- 10 There are different ways to approach finding the height of a pyramid depending on what information is given. For each of the following square-based pyramids, find the exact length of the diagonal of the base and the height of the pyramid to 2 decimal places.

a

Diagonal: $\sqrt{8}$ cm
Height: 3.74 cm

b

Diagonal: $\sqrt{50}$ cm
5.45 cm

TRIGONOMETRY IN 3D

- When working in 3D, simplify the question to 2D.
 - Break down 3D diagram into 2D triangles.
 - Use trigonometry to find unknown sides and angles.

Example Solve problems involving trigonometry in 3D.

Calculate the angle θ .

Round your answer to the nearest minute.

Step 1: Consider relevant triangles.

Step 2: Use triangles to find unknown sides

Calculate OM

$$OM^2 = 8^2 + 11^2$$

$$OM^2 = 185$$

$$OM = \sqrt{185}$$

Calculate θ

$$\tan \theta = \frac{5}{\sqrt{185}}$$

$$\theta = \tan^{-1} \frac{5}{\sqrt{185}} \\ = 20^{\circ}11'$$

How do we know to use trigonometry in this question?

The question involves finding an in a-..... triangle, so it involves trigonometry.

a Find θ to the nearest degree.

b Find θ to the nearest degree.

- 1 The cube shown here has a side length of 2 m.

- a Draw the right-angled triangle $\triangle ABC$ and label all the side lengths.
Answer using exact values.
- b Draw the right-angled triangle $\triangle ACD$ and label all the side lengths.
Answer using exact values.

- c Use trigonometry to find $\angle DAC$, correct to 1 decimal place.

35.3°

- 2 The diagram shows a rectangular prism.

- a Use Pythagoras' theorem to find the length of the base diagonal BE.
- b Hence find the length of the prism diagonal BH.
- c Find, correct to the nearest degree, the angle α that BH makes with the base of the prism.

- a) 15 cm
b) 17 cm
c) 28°

- 3 The diagram shows a triangular prism.

- a Find the exact length of:
- AC
 - AF
- b What is the size of $\angle ACF$?
- c Find $\angle AFC$, correct to the nearest degree.

- a) i) $2\sqrt{5}$ cm ii) $2\sqrt{6}$ cm
b) 90°
c) 66°

- 4 A ramp, ABCDEF, rests at an angle of 20° to the horizontal and the highest point on the ramp is 2.5 metres above the ground, as shown.

- a Find the length BF to 2 d.p.

7.31 m

- b Find the length BD to 2 d.p.

6.87 m

- 5 The diagram shows a rectangular prism. Find, correct to the nearest degree, the angle that the diagonal plane DBFH makes with the base of the prism.

27°

- 6 Consider the rectangular prism. Calculate the angle $\angle FAE$ to the nearest degree.

23°

- 7 The diagram shows a square pyramid.
The point C is the centre of the base, and TC is perpendicular to the base.

- a Write down the size of:
- $\angle CMQ$
 - $\angle TCM$
 - $\angle TCQ$
- b Find the length of:
- CM
 - CQ
- c Find, correct to the nearest degree:
- The angle between a side face and the base.
 - The angle between a slant edge and the base.

- a) i) 90° ii) 90° iii) 90°
b) i) 2 cm ii) $2\sqrt{2}$ cm
c) i) 72° ii) 65°

- 8 The diagram shows a square prism. The plane ABC is inside the prism, and M is the midpoint of the base diagonal BC.

- a) $3\sqrt{2}$ cm
b) 43°

PROBLEMS INVOLVING 3D TRIGONOMETRY

3D Trig Visualisation: <https://www.geogebra.org/m/zksxcu7h>

Example Solve problems involving trigonometry in 3D.

A vertical mast is supported at the top by two cables attached to the ground at A and B. The cable from point A is 36 metres long and is at an angle of 48° to the horizontal. Point B is 24 metres from the base of the mast.

Calculate the angle made between the cable and the ground at point B.

Step 1: Draw right-angled triangles.

Step 2: Use triangles to find unknown sides.

Calculate CD

$$\sin 48^\circ = \frac{CD}{36}$$

$$36 \sin 48^\circ = CD$$

Calculate θ

$$\tan \theta = \frac{36 \sin 48^\circ}{24}$$

$$\theta = \tan^{-1} \frac{36 \sin 48^\circ}{24}$$

$$= 48^\circ 6'$$

Why did we leave CD as $36 \sin 48^\circ$, rather than a rounded decimal?

Leaving in form gives a more answer compared to using the rounded decimal.

From a point X due south of a tower, the angle of elevation of the top of the 150 m tower is 28° . From a point Y due east of the tower, the angle of elevation of the top of the tower is 33° .

Find d , the distance between X and Y , to the nearest metre.

- 1 From a point X due south of a tower 200 m tall on level ground, the angle of elevation of the top of the tower is 41° . From a point Y due east of the tower, the angle of elevation of the top of the tower is 37° .
- Draw and label $\triangle ZOX$
 - Draw and label $\triangle ZOY$
 - Draw and label $\triangle XOY$ and hence find d .

$$d = 351 \text{ m}$$

- 2 Consider the diagram of a tent pole secured by two wires and pegs.

- Find the distance from the base of the pole to peg A.

$$2.25 \text{ m}$$

- Find the distance from the base of the pole to peg B.

$$2.59 \text{ m}$$

- Find the distance between peg A and peg B.

$$3.43 \text{ m}$$

- 3 For this 3D diagram, complete these steps.

- Find AB in exact form.

$$10 \tan 29^\circ$$

- Find θ to 1 d.p.

$$\theta = \tan^{-1} \left(\frac{10 \tan 29^\circ}{8} \right) = 34.7^\circ$$

- Why is it important to keep values in exact form and only round the final answer?
Try finding θ by rounding AB to 1 d.p. and using the rounded result.

If you round too early your final answer will be inaccurate.

$$10 \tan 29^\circ \approx 5.5$$

$$\theta = \tan^{-1} \left(\frac{5.5}{8} \right) = 34.5^\circ$$

This answer is 0.2° different to the answer without rounding.

- 4 The Great Pyramid of Giza is a square pyramid.
It has a perpendicular height of 280 royal cubits and a base length of 440 royal cubits.
Show that the apothem (a) is around 356 royal cubits and it has an angle of inclination of 52° .

$$a = \sqrt{280^2 + 220^2} \approx 356$$

$$\theta = \tan^{-1} \left(\frac{280}{220} \right) \approx 52^\circ$$

- 5 A tree BT is due north of an observer at P and due west of an observer at Q. The two observers are 50 m apart and the bearing of Q from P is 36° . The angle of elevation of T from Q is 28° .

- a Show that $BQ = 50 \sin 36^\circ$.

$$\sin 36^\circ = \frac{BQ}{50}$$

$$BQ = 50 \sin 36^\circ$$

- b Hence find the height h of the tree, correct to the nearest metre.

$$16 \text{ m}$$

- c Find the angle of elevation of T from P, correct to the nearest degree.

$$21^\circ$$

- 6 Two landmarks P and Q on level ground are observed from the top T of a vertical tower BT of height 30m. Landmark P is due south of the tower, while landmark Q is due east of the tower. The angles of elevation of T from P and Q are 15° and 18° respectively.

- a Show that $BP = 30 \tan 75^\circ$,

$$\angle PTB = 75^\circ \text{ (angle sum of a triangle)}$$

$$\tan 75^\circ = \frac{BP}{30}$$

$$BP = 30 \tan 75^\circ$$

- b Find a similar expression for BQ.

$$\text{Similarly, } BQ = 30 \tan 72^\circ$$

- c Find, correct to the nearest metre, the distance between the two landmarks.

$$145 \text{ m}$$

- 7 Calculate the ground distance x .

20 m

- 8 From a point A due north of a flagpole 80 m tall on level ground, the angle of elevation of the top of the flagpole is 38° . From a point B due west of the flagpole, the angle of elevation of the top of the flagpole is 47° . Complete the diagram and calculate the distance AB to the nearest metre.

127 m

- 9 Andrew (A) is on a bearing of 065° from a building which is 150 m tall. Bret (B) is on a bearing of 155° from the same building. The angle of elevation from Andrew to the top of the building is 42° while the angle of elevation for Bret is 61° . The land surrounding the building is level.

How far apart are Andrew and Bret, to the nearest metre?

$$\begin{aligned} AC &= \frac{150}{\tan 42^\circ}, CB = \frac{150}{\tan 61^\circ} \\ \angle ACB &= 155^\circ - 65^\circ = 90^\circ \\ \therefore AB &= \sqrt{AC^2 + CB^2} \\ &= 186 \text{ m} \end{aligned}$$

- 10 A tree is 120 m tall.
From a point C due north on level ground, the angle of elevation of the top of the tree is 51° .
From the point D due east of the tree, the angle of elevation of the top of the tree is 37° .
- Draw a diagram showing this information.
 - Calculate the distance CD to the nearest metre.

187 m

- 11 Two monuments A and B are 400 m apart on the horizontal plane. The angle of depression of A from the top T of a tall building is 18° . $\angle TAB = 52^\circ$ and $\angle TBA = 38^\circ$

- Show that $TA = 400 \cos 52^\circ$
- Find the height h of the building, correct to the nearest metre.
- Find the angle of depression of B from T , to the nearest degree.

$$\text{a) } \angle ATB = 180 - 52 - 38 = 90^\circ$$

$$\cos 52^\circ = \frac{TA}{400}, \therefore TA = 400 \cos 52^\circ$$

$$\text{b) } 76 \text{ m}$$

$$\text{c) } 14^\circ$$

- 12 A motorist on level ground sees, due north of her, a tower whose angle of elevation is 10° . After driving 3 km further in a straight line, the tower is in the direction due west, with angle of elevation 12° .

In this question, no more than two measurements are known in any one of the triangles. Therefore, we must introduce a pronumeral for the height, and work around until we have enough expressions in terms of h such that an equation can be formed and solved.

- Find an expression for AF .

$$\frac{h}{\tan 10^\circ}$$

- Find an expression for BF

$$\frac{h}{\tan 12^\circ}$$

- Use Pythagoras' Theorem to form an equation using h , then solve for h to 3 d.p.

$$AF^2 + BF^2 = AB^2$$

$$\therefore h \approx 0.407 \text{ km}$$

- In what direction was the motorist driving?

$$\text{Let } \theta = \angle FAB, \sin \theta = \frac{FB}{AB}$$

$$\theta \approx 40^\circ$$

she was travelling at a bearing of 040°

- 13** From a point P due south of a vertical tower, the angle of elevation of the top of the tower is 20° . From a point Q 40 metres from P and due east of the tower, the angle of elevation is 35° . h is the height of the tower.

Show that $h = \frac{40}{\sqrt{\tan^2 70^\circ + \tan^2 55^\circ}}$ and evaluate h to the nearest metre.

13 metres

- 14** Two boats at sea are both observing the same lighthouse, which is at a height of 220 m above sea level. From boat A the bearing of the lighthouse is 040°T and the angle of elevation is 12° . From boat B the bearing of the lighthouse is 310°T and the angle of elevation is 17° .

- Complete this diagram.
- Show that $\angle AOB$ is 90°
(Hint: draw the top-down bearing diagram of $\triangle AOB$)
- Calculate the distances OA and OB and hence AB
- Calculate $\angle OAB$ and hence the bearing of boat B from A.

b) $\angle AOB = (360^\circ - 310^\circ) + 40^\circ = 90^\circ$

c) OA = 1035 m, OB = 720 m, AB = 1261 m

d) $\angle OAB = 35^\circ$, bearing = 075°T

- 15** Two boats at sea are both observing the same lighthouse, which is at a height of 520 m above sea level. From boat A the bearing of the lighthouse is 067°T and the angle of elevation is 15° . From boat B the bearing of the lighthouse is 337°T and the angle of elevation is 9° .

- Calculate the distance between the boats.
- Calculate the bearing of boat B from boat A.

a) 3814 m

b) 126°T

- 16** Two boats are observed from a lighthouse 350 m above sea level.
 Boat X is on a bearing of 138°T and at an angle of depression of 23° .
 Boat Y is on a bearing of 228°T and at an angle of depression of 16° .
a Calculate the distance between boat X and boat Y.
b Calculate the bearing of boat Y from boat X.

a) $XY = 1473 \text{ m}$

b) 262°T

- 17** The diagram shows a tower of height h metres standing on level ground.
 The angles of elevation of the top T of the tower from two points A and B on the ground nearby are 55° and 40° respectively.
 The distance AB is 50 metres, and the interval AB is perpendicular to the interval AF , where F is the foot of the tower.

- a** Find AT and BT in terms of h .

$$AT = \frac{h}{\sin 55^\circ}, \quad BT = \frac{h}{\sin 40^\circ}$$

- b** What is the size of $\angle BAT$?

90° , as AB is perpendicular to AF

- c** Hence show that $h = \frac{50 \sin 55^\circ \sin 40^\circ}{\sqrt{\sin^2 55^\circ - \sin^2 40^\circ}}$

$$BT^2 = AT^2 + AB^2$$

$$\frac{h^2}{\sin^2 40^\circ} = \frac{h^2}{\sin^2 55^\circ} + 50^2$$

$$\frac{h^2}{\sin^2 40^\circ} - \frac{h^2}{\sin^2 55^\circ} = 50^2$$

$$\frac{h^2 \sin^2 55^\circ - h^2 \sin^2 40^\circ}{\sin^2 40^\circ \sin^2 55^\circ} = 50^2$$

$$\frac{h^2 (\sin^2 55^\circ - \sin^2 40^\circ)}{\sin^2 40^\circ \sin^2 55^\circ} = 50^2$$

$$h^2 (\sin^2 55^\circ - \sin^2 40^\circ) = 50^2 (\sin^2 40^\circ \sin^2 55^\circ)$$

$$h^2 = \frac{50^2 (\sin^2 40^\circ \sin^2 55^\circ)}{(\sin^2 55^\circ - \sin^2 40^\circ)}$$

$$\therefore h = \frac{50 \sin 40^\circ \sin 55^\circ}{\sqrt{\sin^2 55^\circ - \sin^2 40^\circ}}$$
